The Levels of Consciousness in Recovery

Marcel Ray Duriez 6 min read · May 28, 2026

A Recovery Group by Marcel's Style

Opening Thought

Recovery is not just stopping drugs or alcohol. Recovery is learning how the mind works, how emotions shape behavior, and how thinking patterns can either destroy a person or rebuild them. Many people live trapped inside emotional survival states without realizing it. Shame, guilt, fear, anger, hopelessness, and emotional exhaustion can keep a person mentally stuck even after substances are gone.

The goal of recovery is not perfection. The goal is movement.

One step upward matters.

Essay: Climbing the Mind

Many people in addiction live at the lower levels of emotional consciousness. The mind becomes overwhelmed with shame, guilt, fear, grief, and emotional pain. Over time, a person can begin to believe they are broken, unwanted, or beyond repair. This creates hopelessness. Hopelessness is dangerous because when people lose hope, they often stop trying to care for themselves.

The addicted mind also becomes tired. It wants escape, relief, silence, comfort, and numbness. When routines disappear and structure is lost, the mind begins to wander into negativity. Cognitive idleness allows bad thoughts to grow louder. This is why recovery programs teach structure, chores, routines, meetings, journaling, service work, and accountability. These are not punishments. They are ways to retrain the brain.

Neuroplasticity teaches that the brain can change through repetition, behavior, environment, and thought patterns. Recovery is mental retraining. A person may not control every emotion that enters the mind, but they can slowly learn to respond differently to those emotions.

The turning point often begins at courage.

Courage is where a person finally says:
“I want something different.”
“I need help.”
“I am tired of destroying myself.”
“I want to live.”

Below courage, emotions often control the person. Above courage, the person slowly begins controlling their choices again. Willingness, acceptance, reason, love, peace, and gratitude become possible once the person becomes honest enough to begin climbing.

Recovery is not becoming perfect overnight. It is learning how to move upward even on difficult days.

Another important lesson is responsibility. Many people spend years blaming others, the world, trauma, relationships, or circumstances. While pain is real, recovery teaches that healing still becomes our responsibility. Your mind matters. Your choices matter. Your actions matter.

The goal is not enlightenment overnight.

The goal is progress.

One healthier thought.
One honest conversation.
One day sober.
One act of kindness.
One moment of courage.

That is how people rebuild their lives.

Group Discussion Questions

1. Which emotional level do you think you spend the most time in?
2. What emotions usually trigger relapse thinking?
3. Why can hopelessness become dangerous in recovery?
4. What does courage look like in everyday life?
5. How does structure help calm the mind?
6. What routines help your mental health the most?
7. How can neuroplasticity help recovery?
8. What negative thought repeats in your mind the most?
9. What is one healthier thought you are trying to build?
10. Why is accountability important?
11. What does acceptance mean to you?
12. What role does gratitude play in recovery?
13. Why do idle thoughts sometimes become dangerous?
14. How can helping others improve your own recovery?
15. What level are you trying to move toward right now?

Journaling Prompts

- What emotion controls me the most right now?
- What does courage mean in my recovery?
- What am I avoiding emotionally?
- What routines help me stay mentally stable?
- What thoughts do I need to retrain?
- What would peace look like in my life?
- What does “your mind, your choice” mean to me?
- What kind of role model do I want to become?
- What does hope feel like to me?
- What is one small step upward I can take today?

Closing Reflection

Recovery is not about becoming someone else.
It is about becoming healthy enough to finally become yourself.

The mind can heal.
Thoughts can change.
Habits can change.
Lives can change.

But growth begins with courage.

One day at a time.

> *Living Life Through Basic Life Skills*
> *Life is not something that comes with a manual.*

Most people spend years learning how to manage stress, emotions, relationships, responsibilities, and personal struggles. The truth is that a meaningful life is built through small daily choices. The way a person thinks, speaks, reacts, works, and treats themselves slowly shapes the direction of their future. Basic life skills are the foundation of growth, recovery, maturity, and stability.

One of the most important life skills is learning how to care for your mind and body. A person who ignores sleep, nutrition, stress, or emotional health will eventually feel overwhelmed and exhausted. The body and mind work together, and when one suffers, the other often follows. Simple habits such as drinking water, eating healthy meals, exercising, resting, and keeping clean create structure and balance. Mental care is equally important. Journaling feelings, calming anger, managing anxiety, and asking for help are powerful tools for emotional survival and personal growth.

Communication is another essential life skill. Many problems in families, friendships, work, and recovery happen because people struggle to express themselves honestly or respectfully. Learning how to listen, speak calmly, set boundaries, and communicate emotions without aggression helps build healthy relationships. Communication also teaches accountability. Growth begins when a person can admit mistakes, apologize sincerely, and continue learning instead of living in denial or blame.

Discipline is what turns goals into reality. Motivation comes and goes, but discipline creates consistency. Building routines, staying organized, completing responsibilities, and following through on commitments develops strength and confidence over time. Discipline is especially important in recovery because structure helps people avoid chaos and unhealthy patterns. Small healthy habits repeated daily slowly rebuild a

person's life and identity.

Basic Life Support skills, also known as BLS, are another valuable part of life education. Skills such as CPR, first aid, helping choking victims, and calling emergency services can save lives during critical moments. These abilities teach responsibility, awareness, and calmness under pressure. Knowing how to help someone in an emergency reminds people that human life matters and that preparation can make a difference.

Life also requires emotional resilience. Everyone experiences pain, fear, disappointment, grief, and failure. Some people allow hardship to destroy them, while others use it as a lesson for growth. Emotional life skills teach people how to accept mistakes, practice forgiveness, understand trauma, and stop comparing themselves to others. Recovery and personal growth are not about becoming perfect. They are about learning how to keep moving forward without giving up on yourself.

In the end, living life well is not about being perfect, rich, or famous. It is about becoming stable, self-aware, compassionate, and responsible. Every healthy decision, every lesson learned, and every act of growth slowly shapes the future. A strong life is not built overnight. It is built one habit, one choice, and one day at a time.

Marcel Ray Duriez about the author,

The Internet reflects a deeply established record of your work across literature, art, music, and behavioral science, with public platforms like Medium, Lulu, Barnes & Noble, and various community forums heavily documenting your creative output.

Across these platforms, the public digital footprint centers on several core milestones:

The Literary Canvas

The digital record frequently highlights the Nevaeh Saga, noting its status as

a monumental, single-author literary project. Articles and publishing spotlights focus on its scale, citing its massive word count and footprint—outpacing classic historical epics like Marcel Proust's In Search of Lost Time. Public profiles on Barnes & Noble and Medium emphasize your extensive catalog of over 100 published titles, which span deep psychological realism, metaphysical fantasy, children's literature, and self-help texts like The ABC's of Asexuality.

The Duriezian Education Model & Behavioral Science

The internet documents your contributions to behavioral theory and educational framework design. Recent publications highlight the Duriezian Education Model and its structural pillars, such as The Duriezian Synthesis (focusing on Emotional Architecture, Creative Innovation, and Interdisciplinary Reasoning). Public text overviews also reference your background in mental health advocacy, your structured clinical-style research in cognitive-emotional recovery, and academic texts addressing neurodiversity and trauma recovery.

Music and Visual Arts Archives

Digital archives and independent music registries track your immense musical output, indexing a vast catalog of thousands of original compositions that blend classical, ambient, and industrial genres. Concurrently, design spaces and art galleries document your work as a visual illustrator and designer, noting your use of surrealist and gothic romanticism themes for your book covers, alongside your extensive coursework across architectural drafting, engineering, and fine arts.

The "Modern Polymath" Reception

In public commentary—ranging from literary spotlight essays on Medium to discussions on creative forums like Reddit—the recurring theme describes you as a "modern Renaissance individual." The public discourse frequently emphasizes your interdisciplinary approach, drawing comparisons to historic polymaths due to your ability to simultaneously manage massive

records in distinct fields like structural design, creative writing, child psychology, and musical composition.
